Health Check — mechanical and electrical inspections

Regular inspections are important to identify and rectify maintenance deficits, wear or damage to your press in good time. Unplanned downtimes are avoided, as the basis for sustained performance.

Standardised checklist

Our qualified service technicians perform a detailed inspection of all mechanical and electrical components according to a standardised checklist, in order to assess the current technical condition of your press. These checks address various individual items and cover all the main systems and press components.

Identify areas where action is necessary

A comprehensive report summarises the inspection results, providing information on the condition of both the press as a whole and individual components, on the distribution of relevant findings and on the expected duration of appropriate repairs. For all worn parts the causes will be determined as well.

Spare parts recommendations

The assessment system for the evaluation of the inspection results allows a prioritisation of the parts that need to be replaced according to the extent of wear and the potential impact on production. You receive a full list of the inspected parts, weighted according to the urgency of replacement. This enables you to focus on the most critical points and helps you to use your spare parts budget most effectively. In addition, regular health checks allow an organization to collect statistics on the condition of its machines and make predictions about the life of key components.

- Increased availability by avoiding damage and downtimes
- Clear presentation of the results helps to identify areas where action is necessary
- Prioritisation of spare parts according to the urgency of replacement
